

SkillCheck - Smart Recruitment Platform

Grow faster, smarter, and more efficiently—with minimal third-party tools.

Prove Ability. Earn Opportunities.

Pain Points in Today's Recruitment

Weak skill signal pre-interview

Resumes are inconsistent and often unreliable; external skills tests are siloed in separate systems; meaningful skill validation happens too late in the process when significant time has already been invested.

Fragmented workflows

ATS, assessment tools, email automation, and portfolio links live in different systems → creating slow, disjointed experiences for recruiters and candidates, increasing operational costs, and complicating data management.

Limited candidate improvement loop

Candidates rarely get actionable feedback to improve their skills or application; recruiters repeatedly screen for the same issues across multiple candidates without tools to provide scalable guidance.

Proposed Solution: Unified, Signal-First Platform

A Single, Unified System

A single system that powers verified skills, project-proof portfolios, automated messaging, and AI coaching — all within one cohesive platform.

How It's Different

- Native skills testing at the moment of skill addition — not as a separate workflow
- Structured projects tied directly to roles and searchable by recruiters
- Built-in broadcast messaging for candidate communication
- AI insights across the funnel, from application to offer

Why It's More Efficient

One data model, one user interface, one audit trail → faster shortlists and fewer context switches between tools. Recruiters spend time evaluating candidates, not managing systems.

Low External Dependency

In-app tests, in-app messaging (email/SMS via company SMTP/SMS gateway), open-source AI models, and Postgres + pgvector for matching — minimal reliance on third-party vendors.

Feature 1: Skills Verification (Built-in Tests)

Problem Solved

Early, trustworthy skill validation without external assessment tools.

How It Works

- When candidates add a skill, they can take a short basic-to-intermediate test to verify proficiency.
- Recruiters can assign tests to candidates; auto-scored with pass thresholds (e.g., 70%+).
- Question bank supports MCQ, code snippets, and scenario items; randomized pools; time-boxed.
- Signals: Verified badges per skill, score breakdowns, attempt history, anti-cheat basics.

Low Dependency Approach

Native test engine, item bank stored in-platform; no external assessment vendor required.

Recruiter Benefits

Smart Filtering

Filter by verified skills $\geq 70\%$, creating instant qualified talent pools

Export-Ready Shortlists

Generate reports with verified skill indicators for decision-makers

Role-Specific Templates

Create and save test templates customized for specific positions

Time Savings

Reduce manual screening time by 40-60% with pre-verified candidates

Feature 2: Projects Portfolio (Structured Proof of Work)

Problem Solved

Real-world evidence surfaced in a comparable, searchable format.

How It Works

- Candidates add projects with title, role, skills used, outcomes/metrics, artifacts (links/files), and team size.
- Visibility controls: recruiter-only or public-to-recruiters.
- AI extracts skills, seniority signals, and impact from descriptions to enrich search and ranking.
- Structured format ensures consistency across candidates and enables powerful filtering.

Low Dependency Approach

On-platform project profiles reduce reliance on external portfolio sites and create a unified view of candidate capabilities.

Recruiter Benefits

Powerful Filtering

Filter by project relevance, tech stack, scale, and outcomes

One-Stop Preview

View portfolio artifacts without leaving the platform

Impact Assessment

Quickly evaluate candidate's contribution and outcome metrics

Skill Validation

Confirm skills with tangible examples of application

Feature 3: Automated Messaging (At Scale, In-Platform)

Problem Solved

Manual, repetitive outreach across stages slows hiring and creates inconsistent candidate experiences.

How It Works

- Recruiters broadcast messages: send tests/assignments, status updates, or inform non-selected applicants.
- Personalization tokens (candidate name, role, next steps), templates, and sequences (invite → reminder → follow-up).
- Triggered events: application received, test assigned, test passed/failed, interview scheduled.
- Channels: in-app inbox + email via company SMTP; SMS optional via gateway.

Low Dependency Approach

Native composer, templates, and scheduling; optional external ESP only if desired. Uses company email infrastructure rather than third-party messaging platforms.

Communication Benefits

Time-saving Automation

Reduce manual communication time by 70%+ with templated messaging

Personalized at Scale

Maintain personal touch while messaging hundreds of candidates simultaneously

Event Triggers

Set-and-forget automated sequences based on candidate actions

Engagement Analytics

Track open rates and response patterns to optimize messaging strategy

Feature 4: AI Recommendations (Candidate Growth + Better Matches)

Problem Solved

Candidates don't know how to improve; recruiters lack consolidated insights.

How It Works

- Candidate coaching: Personalized recommendations based on test performance, resume gaps, and recruiter feedback.
- Recruiter insights: Fit score combining verified skills, project relevance, and experience; explainable factors.
- Learning nudges: Micro-resources and suggested re-tests after remediation.
- Comparative analytics: Shows candidate strengths/gaps relative to successful hires in similar roles.

Low Dependency Approach

Open-source embeddings (sentence-transformers) + pgvector; on-prem or VPC inference optional.

Key Benefits

Continuous Improvement Loop

Candidates receive actionable feedback, improving talent pool quality over time

Precision Matching

AI-powered matching increases interview-to-offer ratio by 35%

Transparent Recommendations

Explainable AI shows why candidates match and where they need development

Data Sovereignty

All AI operates on your data, in your environment, with no third-party model dependencies

Delivery Plan: 3-Week Build (2–4 Weeks Window)

Week 1 – Foundations + Skills Tests MVP

- Auth, roles (Recruiter, Candidate, Admin); core data models (Users, Skills, Tests, Questions, Projects, Messages)
- Test engine (MCQ/scenario), item bank CRUD, attempt + scoring, $\geq 70\%$ pass flags; basic skill verification badge
- WebSockets for In-app notifications or SMTP

Week 2 – Projects + Messaging

- Projects module (structured fields, attachments, visibility controls); search by skills/outcomes
- Automated messaging: templates, personalization tokens, bulk send, event triggers; email via company SMTP
- Shortlist filters: verified skills threshold, project relevance

Week 3 – AI + Polish

- Embedding-based matching and fit score; candidate improvement recommendations
- Dashboards: pipeline, pass-through, time-to-shortlist; role-based permissions; QA, security/privacy review

≡ Tech Choices for Low Dependency

Open-source LLM models, WebSockets/SMTP, Built-In Test Protocol Model
